Production Checklist

cross-review-mcp v0.5.2 — What Works, What Doesn't

Integration Status Overview

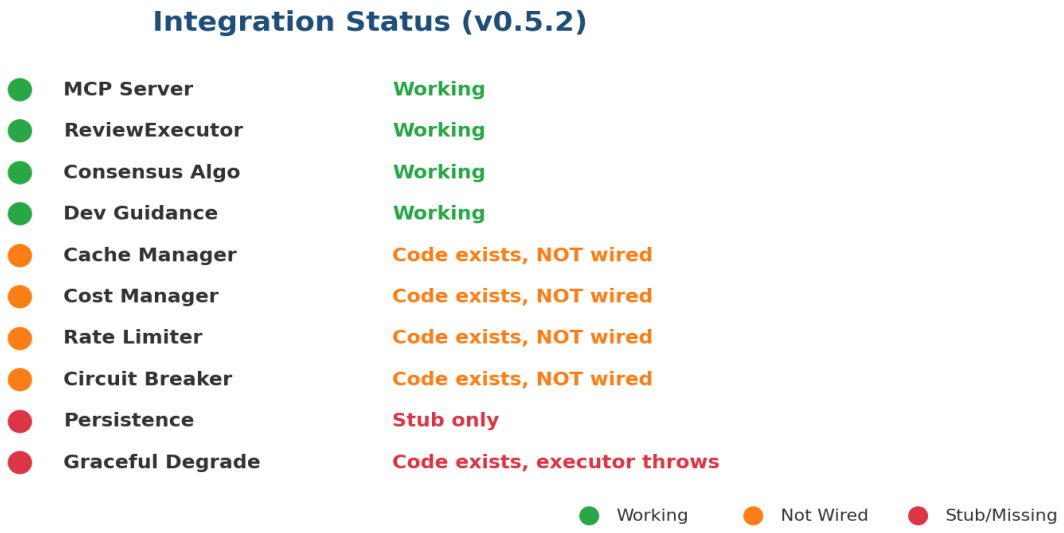

Figure 1: Current module wiring status

What's Working (Verified)

Component	Status	Notes
MCP Server	WORKING	4 tools registered, MCP protocol compliant
ReviewExecutor	WORKING	Parallel execution of 5 providers
Consensus Algorithm	WORKING	Majority diagnosis + divergence detection
Dev Guidance Tool	WORKING	Prompt formatting + response parsing
CLI (cross-review)	WORKING	dev, review, cost, cache commands
TypeScript Build	WORKING	npm run build succeeds
Smoke Tests	WORKING	20+ assertions, no API keys needed
Live Tests	WORKING	E2E with real API calls

Code Exists But NOT Wired Into Executor

Component	Status	What's Missing
Cache Manager	NOT WIRED	Executor doesn't check/write cache
Cost Manager	NOT WIRED	Executor doesn't call trackUsage()
Rate Limiter	NOT WIRED	Executor doesn't throttle requests
Circuit Breaker	NOT WIRED	Executor doesn't use fail-fast
Retry Logic	NOT WIRED	retryWithBackoff() exists but unused
Graceful Degradation	NOT WIRED	Executor throws on missing key

Stubs / Not Implemented

Component	Status	Details
Persistence (SQLite)	STUB	All methods are no-ops (return empty)
Weighted Voting	MISSING	All models equally weighted
Cost Optimization	MISSING	No cheaper-model fallback logic
VS Code Extension	NOT STARTED	
Web Dashboard	NOT STARTED

Documentation Status

Document	Status	Format
README.md	COMPLETE	Markdown + quick start
USER_GUIDE.md	COMPLETE	Markdown
USER_GUIDE.pdf	COMPLETE	PDF with diagrams
TECHNICAL_ARCHITECTURE.md	COMPLETE	Markdown
TECHNICAL_ARCHITECTURE.pdf	COMPLETE	PDF with diagrams
PRODUCTION_CHECKLIST.md	COMPLETE	Markdown
PRODUCTION_CHECKLIST.pdf	COMPLETE	PDF with diagrams
claude.config.json	COMPLETE	MCP config
.env.example	EXISTS	Template
Deployment guide (systemd)	MISSING	

Overall Verdict

Core pipeline works end-to-end. MCP server, executor, consensus, and dev guidance are functional and tested. Documentation is comprehensive.

Supporting modules need wiring. Cache, cost tracking, rate limiting, circuit breaker, and retry logic all exist as code but are not integrated into the executor. This means there is no caching, no cost tracking, no rate limiting, and no graceful degradation in the actual execution path.

Persistence is a stub. The PersistenceManager has the right interfaces but all methods return empty results.
